

README

How to compile and run the code

To run on a unix setup, change the current directory in the terminal to where the *.java lives.

To compile, type:

```
$ javac ISort.java
```

This should generate the .class file in the same directory.

To then run the code, type:

```
$ java ISort <integer-array>
```

where <integer-array> is a space delimited array of integer value of length and values of your choosing.

To run the code with printed debug statements illustrating the steps of the code, type:

```
$ java ISort debug <integer-array>
```
